

This isn't so much a question as a recommendation. We all know that the vaxx mandate is a foregone conclusion. The meeting and vote are mere technicalities. I just hope you put a little science and data behind the decision. Your subjects may have a slightly better chance of accepting this unscientific and VERY politicized decision if they see the numbers.

-Please explain why similarly dense metropolitan areas with no mask mandates, no vaxx mandates and VERY low vaxx percentages do just as well or even better than areas with these draconian restrictions.

-No BS numbers and claims. Like an increase from 4 per 100,000 to 16 per 100,000 is not so much a 400% increase as it is an increase from statistically zero to statistically zero. I WILL point out that kind of crap to as many people as I can. We don't like being lied to.
